DEPARTMENT OF MATHEMATICS
MSC MATHEMATICS

MTS 556	Advanced Discrete Mathematics	4 Credits (48 hours)
----------------	--------------------------------------	-----------------------------

Prerequisite: Knowledge of syllabus prescribed for the course MTH 401 (Algebra - I).

Course Outcome: Students will have the knowledge and skills to develop techniques for constructing mathematical proofs, illustrated by discrete mathematics examples, to design and simplify the logic gate networks by using lattices and Boolean algebra and Karnaugh Maps, and highlight some important applications of graph theory in the development of algorithms in routing and designing computer network finding optimal solutions to some construction problems.

Course Specific Outcome: At the end of the course Students will have the knowledge and skills to understand, explain in depth and apply in various situations the concepts-

- Advanced Counting Principles to solve problems on combinatorics.
- the Polya's counting principle and Polya's inventory problems to solve the problems on coloring.
- Design and simplify the logic gate networks by using lattices and Boolean algebra and Karnaugh Maps.
- Solving problems on extremal graph theory and develop DFS, BFS, and Shortest Path Algorithms.

Unit I

Basic Counting Principles: Number of one-one functions, Permutations, Combinations, Number of onto functions. Partitions and Stirling Numbers of Second kind.

Advanced Counting: Pigeon-hole Principle, Inclusion-Exclusion Principle, Putting Balls into boxes, Round Table Configurations, Counting using Lattice Paths, Catalan Numbers. Recurrence Relations, Generating Functions, Using generating functions to prove results related to certain binomial coefficients.

(18 Hours)

Unit II - Applications of Group Theory:

Recapitulation of Group Action, Orbit Stabilizer Theorem and its applications to Polyá's Counting Principle (Polyá's Theorem (Special Case) and Polyá's Theorem (General Case)) and Polyá's Inventory Problems.

(10 Hours)

Unit III - Boolean Algebras and Switching Functions:

Introduction, Boolean Algebras, Boolean Functions, Switching Mechanisms, Minimization of Boolean Functions, Applications to Digital Computer Design. Switching Functions: Disjunctive and Conjunctive Normal Forms, Gating Networks, Minimal sums of products, Karnaugh Maps and further Applications.

(10 Hours)

Unit IV - Graph Theory:

Introduction, Matching and Factorization. Extremal Graph Theory - Turán's Theorem. DFS, BFS, Shortest Path Algorithms.

(10 Hours)
