

Study of important medicinal plants and their uses.

Acquaintance of plant materials of economic importance of various categories.

BOP512(REV22) Phytochemical methods LAB

Course outcome:

- They work on the estimation and identification of various phytochemicals
- This will stand them in good stead in getting jobs in biochemical based companies

Estimation of Saponins

Estimation of Phenols

Estimation of Flavonoids

Estimation of Starch

Estimation of Lycopene

Estimation of Crude fibre

Extraction of essential oils

Estimation of total sugars by Anthrone method

Phytochemical screening of secondary metabolites

Estimation of alkaloids

Antioxidant activity of plant extracts

Antimicrobial activity of plant extracts

Estimation of Caffeine

Extraction of secondary metabolites through soxhlet apparatus

B0E513(REV22) - Plant Propagation

Teaching Hours:10/Unit

Course outcome:

- There are topics of basics on plant propagation. This helps to even nonbiology students to understand the subject better
- Apart from the basic theory of plant propagation, they will know the infrastructure available for modern plant propagation industry
- There is a chapter covering propagation through seeds. If this is perceived further, they can take up seed production as a career
- A detailed account of the established methods like cuttings, layering, grafting and budding are given. This can help them in establishing a nursery
- Tissue culture methods of propagation are also taught. They can take this up as a career choosing the required crops

Unit I:

History, scope and importance of plant propagation. Propagation structures - green house equipment and media. Modern plant propagation industry.

Unit II:

Biology and Environmental factors: Genetic control in propagation - sexual versus asexual, hormonal control of plant growth and development.

Microclimatic and edaphic factors.

Biotic factors - Pathogen and pest management. Post propagation care.

Unit III:

Seed propagation: Formation of fruit, seed and embryo, polyembryony and apomixes, hormones and seed development. Seed testing, seed storage, seed germination - types. Nursery techniques for transplant production.

Unit IV:

Vegetative propagation: Cuttings - advantages, types, source of cutting materials, rooting media.

Grafting - History, terminology, types - detached scion grafting, approach grafting, repair grafting.

Budding and layering - patch, ring and chip budding.

Layering - simple, tip, mound, air and trench layering.

Unit V:

Micropropagation: Culture techniques - Macro and micronutrients, growth regulators and media. General

laboratory facilities and procedures. Hardening technique. Propagation methods for Banana, Orchid, Anthurium, Gladiolus.
