Weightage for assessments (in percentage)

Type of Course	Formative Assessment / IA	Summative Assessment
Theory	40	60
Practical	25	25(20+5(Practical record))

III Semester B.Sc.,

Course Title: Calculus and Probability Distributions	
Total Contact Hours: 56	Course Credits:04
Formative Assessment Marks: 40	Duration of ESA/Exam: 2 hours
Summative Assessment Marks: 60	

Number of Theory Credits	Number of lecture hours/semester	Number of practical Credits	Number of practical hours/semester
4	56	2	52

Course Objectives

To enable the students to

1. Know the concept of continuity, differentiability, integration of one and more variables.
2. Define and describe properties of Joint, Marginal and conditional distributions of variables and some key concepts of probability theory.
3. Understand different discrete, continuous and sampling distributions, properties and their applications.
4. Generate random variables from various distributions using R-code.

Course Outcomes

After completion of this course the students will be able to

1. Judge continuity of a function, find integrations and solve problems of differentiability.
2. Solve problems of various analytical environments using different distributions and their properties.
3. Find sampling distributions of functions of random variables and explore their applications.

Theory Paper 3 'Calculus and Probability Distributions'

Content of Theory Paper 3	56 Hrs
UNIT 1: Calculus of one and more variables	15 Hrs
Review of calculus of one variable: continuity, differentiability, mean value theorem and Taylor series expansion. Functions of several variables: Continuity, directional derivatives, differentials of functions of several variables, the gradient vector. The mean value theorem, a sufficient condition for the existence of the differential, partial derivatives of higher order and Taylor's formula. Applications of partial differentiation, Jacobian. Riemann integrals, integration by parts, mean value theorem. Multiple integrals and evaluation of multiple integrals by repeated integration, Mean-value theorem for multiple integrals. Sequences and Series of real numbers. convergence of sequences and series, tests for convergence of series. (Only results and applications)	
UNIT 2: Distribution of Random Variables (Two-dimensional)	12 Hrs
Two dimensional random variables: Joint distribution, Marginal distribution and Conditional distributions of random variables, conditional expectation, covariance, correlation and moments. Distribution of functions of random variables using m.g.f. and distribution function. Transformation of variable technique (one and two variables). Chebyshev's inequality- proof and its use in approximating probabilities; Convergence in law and convergence in probability. Statements of Weak Law of Large Numbers; and Central Limit theorems – De-Moivre. (Some simple examples)	
UNIT 3: Probability Distributions-II	16 Hrs

Discrete distributions: Rectangular, Geometric, Negative Binomial, Hypergeometric, Multinomial- definition through probability mass function, mean, variance, moments, p.g.f., m.g.f., other properties and applications. Continuous distributions: Uniform, Gamma, Normal, Exponential, Beta (type 1 and type 2), Cauchy, Weibull– definition through probability density function, mean, variance, moments, m.g.f., other properties and applications. Bivariate normal distribution- definition through probability density function, marginal and conditional distribution.	
UNIT 4: Sampling Distributions and Simulation	13 Hrs
Definitions of random sample, parameter and statistic, sampling distribution of sample mean, standard error of sample mean, sampling distribution of sample variance, standard error of sample variance. Definition and derivation of Student t, Chi-square and F-Distribution-their properties, mean and variance. Limiting form of t distribution. Exact sampling distributions: Distribution of sample mean $\bar{x}$ and sample variance S^2 under normality assumption. when sampling from normal population. Assuming the independence of sample mean $\bar{x}$ and sample variance S^2 when sampling from normal population derive the distribution of $\frac{\bar{x}}{\sqrt{\frac{S^2}{n}}}$. Distribution of 1/F. Relationship between t, F and χ^2 distributions. Introduction to simulation. Generation of random observations from Uniform, Exponential, Normal, Binomial, Poisson distributions using R-codes.

Contents of Practical 3

Note: The first practical assignment is on R-programming. Practical assignments 2 to 10 have to be first solved manually (using scientific calculators) and executed using R-programming.

1. Demonstration of R functions for calculus, distribution of random variables, probability distributions, sampling distribution simulation.
2. Numerical differentiation and integration.
3. Bivariate Probability Distributions - Marginal and Conditional distributions,
4. Bivariate Probability Distributions - Conditional Mean, Conditional Variance, Correlation.
5. Applications of Chebyshev's inequality (For standard distributions such as Normal, Exponential, Gamma).
6. Applications of discrete probability distributions - Negative – Binomial, Geometric, Hyper geometric and discrete uniform, multinomial distributions.
7. Applications of continuous probability distributions - Exponential, Gamma, Cauchy, Weibull distributions.
8. Fitting of discrete and continuous distributions.
9. Generating random sample from discrete distributions.
10. Generating random sample from continuous distributions.

Course Objectives

To enable the students to understand the concepts of

1. Families of distributions, order statistics and their distributions.
2. Estimation, criteria for estimators, methods of estimation, confidence interval.
3. Testing of Hypotheses and its theoretical aspects, large and small sample tests.

Course Outcomes

After completion of the course, the students will be able to

1. Carryout statistical analysis by identifying families of distributions and the use of order statistics.
2. To find estimators using different methods of estimation and compare estimators.
3. To carryout statistical inference using different tests of hypotheses under different scenarios.
4. Generate random variables and use these generated random variable for illustration of concepts studied in this course.

Theory Paper 4 'Statistical Inference-I'

Content of Theory Paper 4	56 Hrs
UNIT 1: Point Estimation-I	16 Hrs
Families of distributions- location and scale families. Single parameter exponential family. Concept of order statistics, Distribution of maximum and minimum order statistics (with proof) and r^{th} order statistic (without proof). Concepts of estimator and estimate. Criteria for estimators: Unbiasedness, Consistency. Invariance property of consistent estimators. Efficiency and relative efficiency. Mean squared error as a criterion for comparing estimators. Sufficient statistics. Statement of Neyman-Factorization theorem.	
UNIT 2: Point Estimation-II	12 Hrs
Fisher information function. Statement of Cramer-Rao inequality and its applications. Minimum Variance Unbiased Estimator and Minimum Variance Bound Estimator. Maximum likelihood and method of moment estimation; Properties of MLE and moment estimators and examples. Method of Scoring	
UNIT 4: Interval Estimation	10 Hrs
Confidence interval, confidence coefficient, shortest confidence interval. Methods of constructing confidence intervals using pivotal quantities. Construction of confidence intervals for mean, difference of two means, variance and ratio of variances, proportions, difference of two proportions and correlation coefficient.	
UNIT 3: Testing of Hypotheses	18 Hrs
Statistical hypotheses - null and alternative, Simple and composite hypotheses. Type-I and Type-II errors, test functions. Randomized and non-randomized tests. Size, level of significance, Power function, power of tests. Critical region, p- value and its interpretation. Most Powerful (MP) and UMP test. Statement of Neyman-Pearson Lemma and its applications. Likelihood ratio tests. Large and small samples tests of significance. Tests for single mean, equality of two means, single variance and equality of two variances for normal populations. Tests for proportions.

Contents of Practical 4

Note: The first practical assignment is on R-programming and R packages. Practical assignments 2 to 10 have to be first solved manually (using scientific calculators) and executed using R-programming.

1. Demonstration of R-functions for estimation and testing of hypotheses.
2. Point estimation of parameters and obtaining estimate of standard errors and mean square error.
3. Computing maximum likelihood estimates.
4. Computing moment estimates.
5. Interval estimation: Construction of confidence interval (large and small samples)
6. uation of Probabilities of Type – I and Type – II errors and power of tests.
7. Small sample tests: Tests for mean, equality of means under normality when variance is (i) known (ii) unknown, P-values.
8. Small sample tests: single proportion and equality of two proportions, variance and equality of two variances under normality. P-values for the above tests.
9. Large sample tests: Tests for mean, equality of means when variance is (i) known (ii) unknown, under normality, variance and equality of two variances under normality. P-values for the above tests.
10. MP and UMP tests for parameters of binomial, Poisson distributions, normal and Exponential (scale parameter only) distributions and power curve.

OPEN ELECTIVE PAPERS:

OE-3: Applied Statistics

OE-4: Biostatistics

OE-3. Applied Statistics

CourseTitle: Applied Statistics	Course Credits:3
Total Contact Hours:42	Duration of ESA:2 hours
Formative Assessment Marks:40	Summative Assessment Marks:60

CourseObjectives

To enable the students to use statistical tools in finance, industries, population studies and health sciences.

To acquire knowledge about sampling methods for surveys.

CourseOutcomes (COs)

Upon successful completion of this course, the student will be able to:

CO1. Understand the Price and Quantity Index numbers and their different measures, understand the applicability of cost of living Index number.

CO2. Know the components and Need for Time series, understand the different methods of studying trend and Seasonal Index.

CO3. Study the concept of vital statistics, sources of data, different measures of Fertility and Mortality, Understand the Growth rates-GRR and NRR and their interpretations.

CO4. Know the concept of Population, Sample, Sampling unit, sampling design, sampling frame, sampling scheme, need for sampling, apply the different sampling methods for designing and selecting a sample from a population, explain sampling and non-sampling errors.

CO5. Describe the philosophy of statistical quality control tools as well as their usefulness in industry and hence develop quality control tools in a given situation.

Pedagogy

The course is taught using traditional chalk and talk method using problem solving through examples and exercises.

Students are encouraged to use resources available on open sources.

Course Contents

Unit1:EconomicStatistics

12Hour

Index numbers: Definition, Criteria for a good index number, different types of index numbers. Construction of index numbers of prices and quantities, consumer price index number. Uses and limitations of index numbers. Consumer price index number: construction of consumer price index

numbers. Applications of consumer price index numbers

Time Series Analysis: Components of time series, Decomposition of time series- Additive and multiplicative model with their merits and demerits, Illustrations of time series.

Measurement of trend by method of free-hand curve, method of semi-averages and method of least squares (linear). Measurement of seasonal variations by method of ratio to trend.

Unit 2: Vital Statistics

12 Hours

Sources of demographic data, errors in data. Measurement of mortality: crude death rate, specific death rates, and standardized death rates, infant mortality rate, maternal mortality

rate, neonatal mortality rates, merits and demerits and comparison of various mortality rates.

Measurement of Fertility and Reproduction: Fecundity, fertility, measurement of fertility, crude birth rate,

general fertility rate, age specific fertility rate and total fertility rates, merits and demerits of each measure

fertility, comparative study of these measures of fertility, Growth rates: Gross reproduction rate and Net reproduction rates.

Unit 3: Sampling Methods

10 Hours

Population and Sample. Need for sampling, Complete Enumeration versus Sample Surveys, Merits and Demerits, Non-Probability and Probability Sampling, Need and illustrations. Use of random numbers, principal steps in sample survey. Requisites of a good questionnaire. Pilot

surveys, Sampling and non – sampling errors, Description of simple random sampling with and without replacement procedures, Merits and demerits of Simple random sampling.

Need for stratification, stratifying factors, Merits and demerits of stratified random sampling. Systematic random sampling procedure of obtaining sample, Merits and demerits of systematic random sampling.

Unit 4: Statistical Quality Control

08 Hours

Concept of quality and its management Causes of variations in quality: chance and assignable.

General theory of control charts, Control charts for variables: X- bar and R-charts.

Control charts for attributes: p and c-charts.

OE-4. Biostatistics

Course Title: Biostatistics	Course Credits: 3
Total Contact Hours: 42	Duration of ESA: 2 hours
Formative Assessment Marks: 40	Summative Assessment Marks: 60

Course Objectives To understand the data types, types of variables and scales of measurement.

1. To understand different descriptive statistics in data analysis. Present data summary in tabular form and graphs.
2. To understand importance of random sampling and sampling technique.
3. To understand the concept of uncertainty in biological sciences and basics of probability and probability distributions.
4. To understand the concept of testing of hypothesis and errors in decision making
5. To know about bivariate and multivariate data, Measures of relationship: correlation and regression.

Course Learning Outcomes

After studying the course, the student will be able to apply statistical tools and techniques in data analysis of biological sciences.

Pedagogy

- The course is taught using traditional chalk and talk method using problems solving through examples and exercises.
- Students are encouraged to use resources available on open sources.

Course Contents

Unit1: Introduction to Bio-Statistics

10 hours

Statistics and Health Science, Role of Biostatistics in Life Sciences.

Definition and scope of Statistics. Scales of Measurement: nominal, ordinal, interval and ratio. Collection, classification and tabulation of data, construction of frequency table for grouped and ungrouped data, graphical representation of data by histogram, polygon, ogive curves and Pie diagram.

Unit2: Descriptive Statistics

12 hours

Measures of Central Tendency: Arithmetic mean, Median and Mode-definition, properties, merits and limitations.

Measures of Dispersion: Range, Standard deviation and Coefficient of Variation. Correlation and Regression Analysis: Bivariate Data, Scatter Diagram, definition of correlation, types of correlation, Karl-Pearson's coefficient of correlation and its properties, Spearman's Rank Correlation coefficient. Regression-Simple linear regression, fitting of regression equations by method of Least Squares, regression coefficients and their properties and interpretation.

Unit3: Probability and Probability Distributions

10 Hours

Probability: Random experiment, sample space, events-mutually exclusive and exhaustive events. Classical, statistical and axiomatic definitions of probability, addition and multiplication theorems, Bayes' theorem (only statements) and its application. Sensitivity, Specificity, positive predictive value, negative predictive value, odds ratio.

Discrete and continuous random variables, probability mass and density functions, distribution functions, expectation of a random variable. Standard univariate distributions: Bernoulli, Binomial, Poisson and Normal distributions (Elementary properties and applications only).

Unit4: Sampling Distributions and Statistical Inference

10 hours

Concepts of random sample and statistic, distribution of sample mean from a normal population, Chi-square, t and F distributions (no derivations) and their applications. Estimation of population mean, population standard deviation and population proportion from the sample counterparts. Statistical hypothesis: null and alternative hypothesis, simple and composite hypothesis. Type I and Type II errors, size, level of significance, power test, critical region, P-value and its interpretation. Test for single mean, equality of two means, single variance, equality of two variances for normal Populations, Test for proportions. ANOVA and Nonparametric Tests.

Detailed Syllabus for Semesters

I Semester & II Semester B.Sc., Minor Statistics

Course Content of Semester-I ; STATISTICS -I

Course Title: Statistics I	Course Credits: 3
Total Contact Hours: 42	Duration of ESA: 2 hours
Formative Assessment Marks: 40	Summative Assessment Marks: 60

Course Title: Statistics I

Theory Content of Statistics I	42 hrs
Unit-1: Introduction to Statistics	13 hrs
Statistics: Definition and scope. Data: quantitative and qualitative, cross sectional and time-series, discrete and continuous. Scales of measurement: nominal, ordinal, interval and ratio. Presentation of data: tabular and graphical. Frequency distributions, cumulative frequency distributions and their graphical representations. Stem and leaf displays. Concepts of population and sample. Methods of sampling - SRS, Stratified, Systematic and Cluster sampling methods: definition only.	
Unit-2: Univariate Data Analysis	17 hrs
Concept of measures of central tendency and measures of dispersion. Mean, weighted mean, trimmed mean, Median, Mode, Geometric and harmonic means, properties, merits and limitations, relation between these measures. Range, Quartile deviation, Mean deviation, Standard deviation and their relative measures. Gini's Coefficient, Lorenz Curve. Moments, Skewness and Kurtosis. Portion Values and measures based on them. Box Plot. Outliers, normal datasets.	
Unit-3: Bivariate Data Analysis	12 hrs
Bivariate Data, Scatter plot, Correlation, Karl Pearson's correlation coefficient, Rank correlation: Spearman's and Kendall's measures. Functional relation between the variables, concept of errors, principle of least squares, Simple linear regression and its properties. Fitting of linear regression line and coefficient of determination their interpretation. Fitting of polynomial and exponential curves.

6. Ross, S. (2002), A First Course in Probability, Prentice Hall.

Pedagogy

- The course is taught using traditional chalk and talk method using problems solving through examples and exercises.
- Students are encouraged to use resources available on open sources.

Formative Assessment: Total 40 marks	
Assessment Occasion/type	Marks
Internal Test 1	15
Internal Test 2	15
Assignment/Seminar/ Data Analysis (7 marks) + Attendance (3 marks)	10
Total	40

Syllabus for III and IV Semester B.Sc. with Statistics as Minor

III Semester B.Sc.

Course Title: Statistics III	
Total Contact Hours:42	Course Credits:03
Formative Assessment Marks:40	Duration of ESA/Exam:2hours
Summative Assessment Marks:60	

Course Objectives

To enable the student to

1. Define and describe properties of Joint, Marginal and conditional distributions of variables and some key concepts of probability theory.
2. Understand different discrete, continuous and sampling distributions, properties and their applications.

Course outcomes

After completion of this course the students will be able to

1. Solve problems of various analytical environments using different distributions and their properties.
2. Find sampling distributions of functions of random variables and explore their applications

Content of ; Statistics III	42Hrs
UNIT1:Distribution of Random Variables(Two-dimensional)	12 Hrs
Two dimensional random variables: Joint distribution, Marginal distribution and Conditional distributions of random variables, conditional expectation, covariance, correlation and moments. Distribution of functions of random variables using m.g.f. and distribution function. Transformation of variable technique (one and two variables). Chebyshev's inequality-proof and its use in approximating probabilities; Convergence in Law and convergence in probability .Statements of Weak Law of Large Numbers; Central Limit theorems – De-Moivre. (Some simple examples)	

UNIT2:ProbabilityDistributions-II	16 Hrs
Discretedistributions:Rectangular,Geometric,NegativeBinomial,Hypergeometric,Multinomial-definitionthroughprobabilitymassfunction,mean,variance,moments,p.g.f.,m.g.f.,otherpropertiesand applications. Continuous distributions:Uniform, Gamma, Exponential, Beta (type 1 and type 2), Cauchy,Weibull– definition through probability density function, mean, variance, moments, m.g.f., other properties and applications. Bivariatenormaldistribution-definitionthroughprobabilitydensityfunction,marginalandconditional distribution.	
UNIT3:Sampling Distributions and Simulation	14Hrs
Definitions of random sample, parameter and statistic, sampling distribution of sample mean, standard error of sample mean, sampling distribution of sample variance, standard error of sample variance. Definition and derivation of Student t, Chi-square and F-Distribution-their properties, mean and variance. Limiting form of t distribution. Exact sampling distributions: Distribution of sample mean $\bar{x}$ and sample variance S^2 under normality assumption. when sampling from normal population. Assuming the independence of sample mean $\bar{x}$ and sample variance S^2 when sampling from normal population derive the distribution of $\frac{\bar{x}}{\sqrt{\frac{S^2}{n}}}$. Distribution of 1/F. Relationshipbetween t, F and χ^2 distributions. Introduction to simulation. Generation of random observations from Uniform, Exponential, Normal, Binomial, Poisson distributions using R-codes. .

Pedagogy

1. The course is taught using traditional chalk and talk method using problem solving through examples and exercises.
2. Students are encouraged to use resources available on open sources.

IV Semester B.Sc.

Course Title: Statistics IV	
Total Contact Hours: 42	Course Credits: 03
Formative Assessment Marks: 40	Duration of ESA/Exam: 3 hours
Summative Assessment Marks: 60	

Course Objectives

To enable the students to understand the concepts of

4. Families of distributions, order statistics and their distributions.
5. Estimation, criteria for estimators, methods of estimation, confidence interval.
6. Testing of Hypotheses and its theoretical aspects, large and small sample tests.

Course Outcomes

After completion of the course, the students will be able to

1. Carry out statistical analysis by identifying families of distributions and the use of order statistics.
2. To find estimators using different methods of estimation and compare estimators.
3. To carry out statistical inference using different tests of hypotheses under different scenarios.
4. Generate random variables and use these generated random variable for illustration of concepts studied in this course.

Theory Paper: Statistics IV

Content of Theory Paper : Statistics IV	42 Hrs
UNIT 1: Point Estimation-I	14 Hrs
Families of distributions- location and scale families. Single parameter exponential family. Concept of order statistics, Distribution of maximum and minimum order statistics (with proof) and r^{th} order statistic (without proof). Concepts of estimator and estimate. Criteria for estimators: Unbiasedness, Consistency. Invariance property of consistent estimators. Efficiency and relative efficiency. Mean squared error as a criterion for comparing estimators. Sufficient statistics. Statement of Neyman-Factorization theorem.	
UNIT 2: Point Estimation-II	12 Hrs
Fisher information function. Statement of Cramer–Rao inequality and its applications. Minimum Variance Unbiased Estimator and Minimum Variance Bound Estimator. Maximum likelihood and method of moment estimation; Properties of MLE and moment estimators and examples. Method of Scoring	
UNIT 3: Testing of Hypotheses	16 Hrs
Statistical hypotheses - null and alternative, Simple and composite hypotheses. Type-I and Type-II errors, test functions. Randomized and non-randomized tests. Size, level of significance, Power function, power of tests. Critical region, p- value and its interpretation. Most Powerful (MP) and UMP test. Statement of Neyman-Pearson Lemma and its applications. Likelihood ratio tests. Large and small samples tests of significance. Tests for single mean, equality of two means, single variance and equality of two variances for normal populations. Tests for proportions.
